# 1 Introduction

This volume, AQ1, contains the air quality (AQ) data dictionary. Volume AQ2, describes coding of the AQ data transactions. It describes the views, records, and fields used by AQS.

The data dictionary is organized by sections.

Section 2 lists terms used throughout the document, and their meaning in the context of this document. Types of terms would include: database definition terms, and math functions.

Section 3 describes the AQS views. The initial subsection presents data model diagrams that show the relationships between the views. The subsequent subsections are descriptions of the individual views. Each view description includes: a narrative explaining its purpose, content, and use; a description of the fields contained in the view.

Section 4 describes the AQS fields. The fields are presented in alphabetic order. Field descriptions include:

1. A narrative describing the field, including its uses;
2. Those parts of AQS that are the source of the data;
3. The data type, length, and whether the field is required;
4. The views in which the field is used;
5. Any rules of value assignment, including algorithms and formulas.

## 2 Description of Terms

| <b>Term</b>         | <b>Definition</b>   |
|---------------------|---|

| Database Field Name | The Oracle field name for an AQS data element. The name must conform to Oracle field name constraints, e.g., a maximum of 30 characters, no spaces, no punctuation marks, etc. The database field name will generally represent be an abbreviated form of the AQS field name. |

| <b>Term</b>         | <b>Definition</b>   |
|---------------------|---|
| Field Type (Length) | <p>There are four field types used in AQS: character, numeric, float, and date.</p> <p>The lengths represent the length of the underlying physical field. The physical length is large enough to accommodate the current lengths used plus any future growth. For example, Method Code has a length of 8, which accommodates the 3-digit logical length currently used and any conceivable expansion needed in the future.</p> <p>Character types have maximum lengths associated with them. The lengths of numeric fields are indicated by the number of digits to the left and right of the decimal point. For example, a numeric field with a length of 8.2 has 8 digits to the left of the decimal point, and 2 to the right, for a maximum of 10, i.e., nnnnnnnn.nn. Date and float types have a fixed length by definition. The date type includes both date and time in that same fixed length; the float type can accommodate numbers in the range of 1.0E-129 through 9.999E125.</p> |

## 3 AQS Views

### 3.1 Data Model

## 3.2 Sites

### 3.2.1 Description

The Sites view contains information about Air Quality Sites, including: geographical information, (e.g., latitude and longitude, Universe Transverse Mercator, i.e., UTM coordinates), historical information, (e.g., established and terminated dates), site location information, (e.g., street address, city, Air Quality Control Region or AQCR), and other general characteristics, (e.g., land use, location setting). In addition, the view contains all information required by the Locational Data Policy. A Sites record is uniquely identified by the combination of state, county, and site ID. Alternative unique identifiers are the latitude-longitude combination, and the UTM coordinates. Its parent is the Counties view; its child views are: Tangent Roads, Open Paths, Monitors, and Comments.

## 3.18 Composite Data

### 3.18.1 Description

The Composite Data view contains the concentrations of air pollutants as measured by air monitoring equipment from composite air samples. In the composite sampling technique, two or more air samples obtained at different times are combined and analyzed as one sample. This yields something of an average concentration for the time period during which the individual samples were collected. A Composite Data record is uniquely identified by the combination of monitor, year, and composite period. Its parent is the Monitor Protocols view; its child view is Composite Qualifier Details.

## 3.20 Raw Data

### 3.20.1 Description

The Raw Data view contains the concentrations of various air pollutants as measured by air monitoring equipment throughout the U.S. The values may result from equipment that monitors continuously, or monitors that require manual intervention to collect the data, e.g., a monitor that draw air through a filter would require the removal and weighting of the filter to determine the amount of particulate matter in the sampled air. A Raw Data record is uniquely identified by the combination of monitor and date/time. Its parent is the Monitor Protocols view; its child view is Raw Qualifier Details.

## 3.22 Precision Data

### 3.22.1 Description

The Precision Data view contains the precision check results for monitors for a pollutant. Precision checks are determined by performing repeated measurements of ambient-level “calibration” gases at two-week intervals for continuous analyzers, or by obtaining duplicate results from collocated samplers for manual methods. Precision Data record is uniquely identified by the combination of monitor and date. Its parent is the Monitor Protocols view.

### **4.71.5 Value Assignment**

#### **4.71.5.1 Collocated**

A valid collocated value pair is one where both the primary and duplicate value exceeds the minimum collocated value defined for the parameter on the Parameters view. The minimum values for criteria pollutants are:

| <b>Parameter</b> |             | <b>Minimum</b>            |
|------------------|-------------|---------------------------|
| <b>Code</b>      | <b>Name</b> | <b>Value</b>              |
| <b>11101</b>     | TSP         | 20 µg/m <sup>3</sup> SC   |
| <b>12128</b>     | Lead        | .015 µg/m <sup>3</sup> SC |
| <b>42401</b>     | SO2         | .01717 ppm                |
| <b>42602</b>     | NO2         | .01593 ppm                |
| <b>81102</b>     | PM10        | 20 µg/m <sup>3</sup> SC   |
| <b>88101</b>     | PM2.5       | 6 µg/m <sup>3</sup> LC    |

where:

ppm - parts per million

µg/m<sup>3</sup> SC - micrograms per cubic meter (standard conditions)

µg/m<sup>3</sup> LC - micrograms per cubic meter (local conditions).

If a minimum collocated value is not defined for the parameter, then the value pair is assumed valid.

#### **4.77.5.1 1-Hour & 8-Hour Ozone**

The number of active days within the effective monitoring season.

#### **4.77.5.2 Daily PM10 & PM2.5**

Scheduled days are the number of days within the year that were scheduled for sampling, as determined by the EPA-defined calendar for the required collection frequency, and which also fall within the period of operation, as defined by sampling periods.

Seasonal and random frequencies are sub-divided in monthly-required frequencies; otherwise, the required frequency applies to a defined period of time. A PM10 or PM2.5 monitor must have a defined collection frequency for each active day, by rule.

The reference point for the EPA calendar is January 4, 1956. For example, in the year 2003, the every 6<sup>th</sup> day calendar would comprise: 1/3/2003, 1/9/2003, 1/15/2003, etc., and the every 3<sup>rd</sup> day calendar would comprise: 1/3/2003, 1/6/2003, 1/9/2003, 1/12/2003, etc. For a monitor doing seasonal sampling, with every 6<sup>th</sup> day sampling in April and every 3<sup>rd</sup> day sampling in May, both months in 2003, the schedule would be as follows: 4/15/03, 4/21/03, 4/27/03, 5/3/03, 5/6/03, 5/9/03, etc.

#### **4.78.5.2 Daily PM10**

The number of valued strata in the year. (A valued stratum is where at least one observation is made on, or after, a scheduled day, but before the next scheduled day.)

#### **4.78.5.3 Daily PM2.5**

The sum of valued, scheduled sampling days, plus make-ups for missing scheduled days. A make-up day is a sample recorded in the same stratum as, or exactly seven days after, a missing scheduled sample. In both conditions, the make-up sample must occur within the same quarter as the missed sample. A maximum of five make-up samples are allowed per quarter.

## **4.102 Estimate of Days Greater Than Standard**

### **4.102.1 Description**

The estimated number of days greater than the standard is computed and is utilized to determine whether the standard is attained. It is computed for specific pollutants when an exceedance has occurred during the year. The underlying assumption is that missing data is just as likely to exceed the standard as reported data.

### **4.102.2 Source**

System-generated via the Post process.

### **4.102.3 Attributes**

Type: Number

Length: 3.2

Required: No

### **4.102.4 Uses**

*Annual Summaries*

### **4.102.5 Value Assignment**

The estimate exceedance is rounded to 1 decimal place.

#### **4.102.5.1 1-Hour Ozone**

$$e = d + \left( \left( \frac{d}{v} \right) * (r - v - a) \right)$$

where

*e* = expected days greater than the standard,

*r* = Count of Required Days,

*v* = Count of Valid Days,

*a* = Count of Missing Days Assumed Less Than Standard,

*d* = Count of Primary Exceedances.

## 4.102.5.2 Daily PM10

$$e = \sum_{q=1}^4 e_q$$

where:

$e$  = estimated number of exceedances for the year,  
 $e_q$  = the estimated number of exceedances for calendar quarter  $q$ ,  
 $q$  = the index for calendar quarter,  $q=1, 2, 3$  or  $4$ .

The estimate of the expected number of exceedances for a quarter is calculated using the following formula:

$$e = \left(\frac{a}{v}\right) * \sum_{j=1}^v \left(\frac{x_j}{n_j}\right)$$

where:

$e$  = the estimated number of exceedances for calendar quarter  $q$ ,  
 $a$  = the number of days in calendar quarter  $q$ ,  
 $v$  = the number of valued strata in calendar quarter  $q$ ,  
 $x_j$  = the number of exceedances in stratum  $j$ ,  
 $n_j$  = the number of observations in stratum  $j$ .

The quarterly exceedance estimate is set to 1 for a calendar quarter in which the first observed exceedance has occurred if:

1. There was only one exceedance in the calendar quarter,
2. Everyday sampling is subsequently initiated and maintained for 4 calendar quarters, in accordance with 40 CFR 58.13,
3. Data capture of 75 percent is achieved during the required period of everyday sampling.

In addition, if the first exceedance is observed in a calendar quarter in which the monitor is already sampling every day, no adjustment for missing data will be made to the first exceedance if a 75 percent data capture rate was achieved in the quarter in which it was observed.

#### 4.102.5.3 24-Hour PM10

$$e = \sum_{q=1}^4 e_q$$

where:

$e$  = estimated number of exceedances for the year,  
 $e_q$  = the estimated number of exceedances for calendar quarter  $q$ ,  
 $q$  = the index for calendar quarter,  $q=1, 2, 3$  or  $4$ .

The estimate of the expected number of exceedances for a quarter is calculated using the following formula:

$$e = v * \left( \frac{a}{n} \right)$$

where:

$e$  = the estimated number of exceedances for calendar quarter  $q$ ,  
 $v$  = the observed number of exceedances for calendar quarter  $q$ ,  
 $a$  = the number of days in calendar quarter  $q$ ,  
 $n$  = the number of observations in calendar quarter  $q$ .

The quarterly exceedance estimate is set to 1 for a calendar quarter in which the first observed exceedance has occurred if:

1. There was only one exceedance in the calendar quarter,
2. Everyday sampling is subsequently initiated and maintained for 4 calendar quarters in accordance with 40 CFR 58.13,
3. Data capture of 75 percent is achieved during the required period of everyday sampling.

In addition, if the first exceedance is observed in a calendar quarter in which the monitor is already sampling every day, no adjustment for missing data will be made to the first exceedance if a 75 percent data capture rate was achieved in the quarter in which it was observed.

## 4.114 Horizontal Accuracy

### 4.114.1 Description

Description of the accuracy of the site coordinates, as a range reported in meters. Only the least accurate measurement needs to be recorded, whether it is latitude or longitude (or Universal Transverse Mercator (UTM) coordinates).

For example, here are accuracy standards for various scale maps, assuming that the maps conform to the national mapping accuracy standards:

|                         |
|-------------------------|
| 1:1,200 ± 3.33 feet     |
| 1:2,400 ± 6.67 feet     |
| 1:4,800 ± 13.33 feet    |
| 1:10,000 ± 27.78 feet   |
| 1:12,000 ± 33.33 feet   |
| 1:24,000 ± 40.00 feet   |
| 1:63,360 ± 105.60 feet  |
| 1:100,000 ± 166.67 feet |

Map interpolation would also introduce error.

For Global Positioning System (GPS), the accuracy values vary. The type of GPS used along with operating conditions affect accuracy. The GPS receiver may provide accuracy values associated with specific coordinate readings.

This data element is required by EPA Locational Data Policy (LDP). More information regarding EPA's data standards and policies may be found on EPA's Environmental Data Registry (EDR) Website (<http://www.epa.gov/edr/>).

#### **4.135.5.1 Ozone (1-Hour & 8-Hour)**

The ten highest 1-hour or 8-hour *Maximum Value (Daily)* values for the year, regardless of monitoring season or whether daily summary criteria were met.

#### 4.135.5.2 Non-Overlapping 8-Hour Carbon Monoxide

The two highest valid 8-hour *Arithmetic Mean (NAAQS)* values of the year where there is at least one other non-overlapping *Arithmetic Mean (NAAQS)* that is greater than, or equal to, the second highest average, and the dates and hours for which each was computed. (Note: The first actual maximum is always the first non-overlapping maximum.)

In the following example, the fourth actual maximum is the second non-overlapping maximum because, while it overlaps the first and second actual maximums, it does not overlap the third. Since the second actual overlaps the first, and the third overlaps both the first and second, neither one qualifies to be the second non-overlapping maximum.

#### **4.169.5.1 1-Hour & 8-Hour Ozone**

$$p = \left( \frac{n}{q * 24} \right) * 100$$

where:

$p$  = observation percentage,

$n$  = number of samples or 8-hour averages in the quarter, regardless of monitoring season,  
(i.e., *Count of Observations (Quarterly)*),

$q$  = number of active days in the quarter, regardless of monitoring season.

#### **4.169.5.2 24-Hour PM2.5 & PM10**

$$p = \left( \frac{n}{q} \right) * 100$$

where:

$p$  = observation percentage,

$n$  = number of valid 24-hour block averages (i.e., *Number of Observations (Quarterly)*),

$q$  = number of active days in the quarter.

### 4.169.5.3 Daily PM10

$$p = \left( \frac{v}{q} \right) * 100$$

where:

$p$  = observation percentage,

$v$  = number of valued strata (i.e., *Count of Valid Days*),

$r$  = number of scheduled days (i.e., *Count of Required Days*).

A valid stratum is one where the scheduled day occurs in the quarter and at least one observation occurs in the stratum.

Scheduled days are the number of days within the quarter that were scheduled for sampling, as determined by the EPA-defined calendar for the required collection frequency, and which also fall within the period of operation, as defined by sampling periods.

Seasonal and random frequencies are sub-divided in monthly-required frequencies; otherwise, the required frequency applies to a defined period of time

The reference point for the EPA calendar is January 4, 1956. For example, in the year 2003, the every 6<sup>th</sup> day calendar would comprise: 1/3/2003, 1/9/2003, 1/15/2003, etc., and the every 3<sup>rd</sup> day calendar would comprise: 1/3/2003, 1/6/2003, 1/9/2003, 1/12/2003, etc. For a monitor doing seasonal sampling, with every 6<sup>th</sup> day sampling in April and every 3<sup>rd</sup> day sampling in May, both months in 2003, the schedule would be as follows: 4/15/03, 4/21/03, 4/27/03, 5/3/03, 5/6/03, 5/9/03, etc.

#### 4.169.5.4 PM2.5

$$p = \left( \frac{v}{r} \right) * 100$$

where:

$p$  = observation percentage,  
 $v$  = *Count of Valid Days*,  
 $r$  = number of scheduled days (i.e., *Count of Required Days*).

Valid days are equal to the sum of valued, scheduled sampling days, plus make-ups for missing scheduled days. A make-up day is a sample recorded in the same stratum as, or exactly seven days after, a missing scheduled sample. In both conditions, the make-up sample must occur within the same quarter as the missed sample. A maximum of five make-up samples are allowed per quarter.

Scheduled days are the number of days within the quarter that were scheduled for sampling, as determined by the EPA-defined calendar for the required collection frequency, and which also fall within a period of operation, as defined in sampling periods.

Seasonal and random frequencies are sub-divided in monthly-required frequencies; otherwise, the required frequency applies to a defined period of time. A PM2.5 monitor must have a defined collection frequency for each active day, by rule.

The reference point for the EPA calendar is January 4, 1956. For example, in the year 2003, the every 6<sup>th</sup> day calendar would comprise: 1/3/2003, 1/9/2003, 1/15/2003, etc., and the every 3<sup>rd</sup> day calendar would comprise: 1/3/2003, 1/6/2003, 1/9/2003, 1/12/2003, etc. For a monitor doing seasonal sampling, with every 6<sup>th</sup> day sampling in April and every 3<sup>rd</sup> day sampling in May, the scheduled days for 2003 would be as follows: 4/15/03, 4/21/03, 4/27/03, 5/3/03, 5/6/03, 5/9/03, etc.

#### 4.169.5.5 Default Hourly

$$p = \left( \frac{n}{\left( a * \frac{24}{l} \right)} \right) * 100$$

where:

$p$  = observation percentage,  
 $n$  = *Count of Observations (Quarterly)*,  
 $l$  = duration length (in hours),  
 $a$  = number of active days in the quarter.

The 1-hour or 8-hour *Maximum Value (Daily)* where there are  $k$  *Maximum Value (Daily)* values less than or equal to it, where  $k$  is the calculated rank for the *Percentile*. The formula for determining the rank is:

$k$  = percentile rank

$p$  = *Percentile*,

$v$  = *Count of Valid Days*.

### 4.171.5.2 Daily Non-Seasonal PM2.5

The sample value where there are  $k$  values less than or equal to it, where  $k$  is the calculated rank for the percentile. The formula for determining the rank is:

$$k = \text{CEILING} \left( \sum_{q=1}^4 \text{MINIMUM}(r_q, n_q) * \left( \frac{p}{100} \right) \right) + n - \left( \sum_{q=1}^4 \text{MINIMUM}(r_q, n_q) \right)$$

where:

$k$  = percentile rank  
 $r_q$  = number of required samples for the quarter,  
 $n_q$  = number of actual samples for the quarter,  
 $q$  = quarter,  
 $p$  = Percentile,  
 $n$  = Count of Observations (Annual).

Note: A CEILING function returns the smallest integer higher than, or equal to, the given number. A MINIMUM function returns the least of a series of numbers.

### 4.171.5.3 Daily Seasonal PM2.5

The minimum sample value that makes:

$$W(x) > \left( \frac{p}{100} \right)$$

where:

$$W(x) = \left( \left( \frac{d_h}{d_h + d_l} \right) * F_h(x) \right) + \left( \left( \frac{d_l}{d_h + d_l} \right) * F_l(x) \right)$$

where:

$d_h$  = number of calendar days in the high season,

$d_l$  = number of calendar days in the low season,

$p$  = *Percentile*,

$x$  = the measured concentration, and

$$F_a(x) = \frac{l_a}{n_a}$$

where:

$a$  = high or low,

$l_a$  = number of samples in season  $a$  that are  $\leq x$ ,

$n_a$  = number of samples in season  $a$ .

The high season are those months where the monthly required frequency is that with minimum daily interval for the year; the low season is all others months.

(Reference: EPA-454/R-99-008 Guideline on Data Handling Conventions for the PM NAAQS)

#### 4.171.5.4 Hourly and Non-PM2.5 Daily

The sample value where there are  $k$  sample values less than or equal to it, where  $k$  is the calculated rank for the percentile. The formula for calculating the rank is:

The valid 8-hour average where there are  $k$  valid 8-hour averages less than or equal to it, where  $k$  is the calculated rank for the percentile. The formula for calculating the rank is:

$$k = \text{CEILING}\left(n * \left(\frac{p}{100}\right)\right)$$

where:

$k$  = percentile rank

$p$  = *Percentile*,

$n$  = *Count of Observations (Annual)*.

Note: A CEILING function returns the smallest integer higher than, or equal to, the given number.

## **4.172POC**

### **4.172.1 Description**

Pollutant Occurrence Code. An identifier used to distinguish between multiple monitors at the same site that are measuring the same parameter. For example, the first monitor established to measure carbon monoxide (CO) at a site could have a *POC* of 1. If an additional monitor were established at the same site to measure CO, that monitor could have a *POC* of 2. However, if a new instrument were installed to replace the original instrument used as the first monitor, that would be the same monitor and it would still have a *POC* of 1.

For criteria pollutants, data from different sampling methods should only be stored under the same *POC* if the sampling intervals are the same and the methods are reference or equivalent. For sites where duplicate sampling is being conducted by multiple agencies or by one agency with multiple samplers, multiple *POCs* must be utilized to store all samples.

For non-criteria pollutants, data from multiple sampling methods can be stored under the same *POC* if the sampling intervals are the same and there is only one sample for the time reported. If multiple open path monitors are reporting data for the same parameter, each open path would be assigned a different *POC*.

## **4.212 Site ID**

### **4.212.1 Description**

A numeric identifier (ID) that uniquely identifies each air monitoring site within a county. There is no requirement that *Site IDs* be assigned continuously or in any particular order. Local organizations are thus free to allocate *Site IDs* in any way they choose, as long as there is no duplication within a county.

A specific *Site ID* is associated with a specific physical location and address. Any change in address requires a new *Site ID* to be assigned. This address change could include a change from the roof of one building to another. A change in location on the same roof should not normally require a new *Site ID*. Although an address change would routinely mean a new *Site ID*, some changes that do not change the site's location in respect to surrounding sources and its measurement scale would require no change. An EPA regional office should be consulted for assistance in determining whether a new site ID is required.

If a new *Site ID* is needed for a site not operated by the air pollution control agency, that agency should be contacted to assist in the ID assignment, to ensure that the ID is unique within the county. In other words, when a new *Site ID* is assigned, it must be different from any other *Site ID* already existing for that combination of *State Code* and *County Code*.

## **4.214 Source Scale**

### **4.214.1 Description**

Identifies the ratio of the map or cartographic product to the true location. The data element for scale should be the X value of the 1:X ratio (e.g., if the scale is 1:24,000, the value of the scale data element should be 24,000). The United States Geological Survey 1:24,000 is usually the smallest reasonable scale for locating sub-facility points, such as stacks or pipes. The relative accuracies of maps as a locational tool decreases as the X value increases.

This data element is required by EPA Locational Data Policy. More information regarding EPA's data standards and policies may be found on EPA's Environmental Data Registry (EDR) Website (<http://www.epa.gov/edr/>).

### 4.217.5.4 Federal Reference Method (FRM) Audit

$$S = \sqrt{\frac{\left( \left( n * \sum_{i=1}^n d_i^2 \right) - \left( \sum_{i=1}^n d_i \right)^2 \right)}{(n * (n - 1))}}$$

where:

$S$  = standard deviation,

$d_i$  = *Percent Difference* of an FRM audit pair ([2.1.3 Percent Difference](#)),

$n$  = number of FRM audits (i.e., *Count of Checks (Reporting Organization Precision Summary)*),

and  $n > 1$ .

If  $n = 1$ , then the standard deviation is assigned to be 0.

## 4.218 Standard Deviation (Reporting Organization Accuracy Summary)

### 4.218.1 Description

The measure of the dispersion about the central tendency of a pollutant that is the square root of the precision mean of the squares of the variation of each Relative Percent Differences of a value pair from the precision mean of the Relative Percent Differences of the value pairs for the time period.

### 4.218.2 Source

System-generated, via the Accuracy Data (RA) Transaction AQ2, or Maintain Accuracy Data (L62).

### 4.218.4 Uses

### 4.218.5 Value Assignment

$$S = \sqrt{\frac{\left( \left( n * \sum_{i=1}^n d_i^2 \right) - \left( \sum_{i=1}^n d_i \right)^2 \right)}{(n * (n - 1))}}$$

where:

$S$  = standard deviation,

$d_i$  = *Percent Difference* of a analytical or flow audit,

$n$  = *Count of Audits (Reporting Organization Accuracy Summary)*.

If either quarter in either half of the year has an *Count of Audits (Reporting Organization Accuracy Summary)* of 1, then the source data for both quarters in that half will be merged for purposes of calculating the standard deviation, and reported with the second quarter of the half (i.e., Q2 or Q4). In this case, there will be no value for the corresponding first quarter in the half (i.e., Q1 or Q3).

### 4.220.5 Value Assignment

Each *Reported Unit-Standard Unit* combination has a record in the *Unit Conversions* view. That record specifies the values to be used in the following formula:

$$v = s + (l * r * m^i * c^j)$$

where:

$v$  = the value in standard units (*Standard Sample Value*),

$s$  = the scalar factor,

$l$  = the linear factor,

$r$  = the sample value in reported units (*Reported Sample Value*),

$m$  = the molecular weight of the *Parameter*,

$i$  = indication of whether molecular weight applies, (0 means “No”, 1 means “Yes”),

$c$  = the carbon count of the *Parameter*,

$j$  = indication of whether carbon count applies, (0 means “No”, 1 means “Yes”).

When the calculated *Standard Sample Value* is less than the applicable method detectable limit (MDL), (and where the *Parameter* is not 88101), the calculated value is superceded by a value equal to ½ the applicable MDL. When such a substitution occurs, the *Half MDL Substitution Indicator* is set to “Y”.

For any sample, the applicable MDL generally is that which is assigned to the method by the EPA. This EPA-assigned, i.e., federal, MDL, may be superceded by an *Alternative MDL*. An *Alternate MDL* is specified by the submitting agency as part of a raw data transaction. This *Alternative MDL* is stored with the corresponding *Monitor Protocol*, and is converted to the

*Standard Unit*, using the above formula, for comparison to the calculated *Standard Sample Value*.

A *Standard Sample Value* that is either greater than, or equal to, the applicable MDL, or for ozone (44201), regardless of relation to the applicable MDL, is subject to rescaling. The scaling factor is assigned to the method by the EPA, i.e., *Standard Scale*. Rescaling is either rounding or truncation of the *Standard Sample Value* to the number of decimal places specified in the *Standard Scale*. Each record in the *Parameters* view has a *Conversion Indicator* field, which specifies whether truncation or rounding applies. (Rounding is the default.)
